Plumbing Specifications:

- 1. These plans are diagrammatic only. Contractor shall provide all necessary offsets, elbows, tees, etc for a complete working system.
- 2. Contractor shall obtain and pay all fees related to permitting, inspections, taps, etc.
- Coordinate with GC to confirm none of these costs are covered by them. 3. All work shall be coordinated with all other trades prior to installation. Contractor shall coordinate routing of all piping with existing and new conditions and shall provide any necessary rerouting, offsets, etc. required for a completely coordinated and working svstem.
- 4. The plumbing system shall be installed in accordance with 2018 NC plumbing code and local AHJ requirements.
- 5. New portion of the domestic water system shall be purged of damaging matter and disinfected in accordance with 2018 NC Plumbing code. Remove dirt and debris as work progresses. Submit third-party witness reports of purging and disinfecting activities.
- 6. All plumbing systems shall be tested as required per 2018 NC Plumbing Code. 7. All piping systems shall be strapped and supported as required by 2018 NC Plumbing
- Code & the manufacturer's recommendations. 8. Plumbing contractor shall provide cleanouts in compliance with IPC section 708, as well as the following locations:
- as indicated on plans - at the base of the waste stack
- at every two 90° turns or every four 45° turns - on all horizontal waste line, no further than 100 feet apart
- 9. Plumbing fixtures with automatic or quick-closing valves and kitchen equipment shall have a shock arrestors, piston type water hammer arrestor, sized according to manufacturer's
- recommendations & PDI standards. 10. All overhead domestic water piping (above slab) shall be type "L" copper with 95/5 lead free solder. All below grade water piping shall be type "K" soft copper. Each complying with ASTM B-88. All piping shall have manufacturers name and the applicable standard to which it was made clearly labeled on each length. Contractor shall use brazed joints on all piping 1 1/2" and larger.
- 11. Water piping shall be insulated with closed cell (Armacell) type insulation with a smoke density rating not exceeding 50 and a flame density rating not exceeding 25. Thickness for cold water piping insulation shall be 1/2" thick, thickness for hot water & return piping insulation shall be 1" thick.
- 12. Branch lines and base of risers shall have, shut-off valves. All domestic water ball valves shall be a brass body, full port, with a chrome plated ball, Teflon seals, 600 WOG, for sizes 1/2" thru 3". Sizes above 3" shall be a bronze gate valve, NRS, solid disc, cutoff valve, screw-over bonnet, 400 WOG. Provide valve handle extensions if necessary due to insulation.
- 13. Storm, waste, and vent piping, above slab, shall be PVC Schedule 40 DWV with piping and fittings conforming to ASTM D-2665.
- 14. The backflow prevention device shall be installed as required per local AHJ. Purge water piping before setting backflow preventer.
- 15. Sanitary sewer piping shown is below slab or within walls unless otherwise noted. Sanitary vent piping shown is within wall and above ceiling unless otherwise noted. 16. Domestic water piping shown on drawing is above ceiling or within walls unless otherwise noted
- 17. The plumbing contractor shall coordinate all underslab plumbing piping with all structural
- foundations and footings and all underslab plumbing piping elevation inverts with site utility. 18. All piping penetrations thru new or existing walls and/or floors shall be sealed to equal the
- rating of the new or existing wall or floor. 19. All vent thru the roof penetrations shall be coordinated with the general contractor. Plumbing contractor shall provide all flashing material required for vent thru roof. Vents thru
- the roof shall be located a minimum of 10'-0" away from all fresh air intakes. 20. Contractor shall coordinate any plumbing work requiring shutdown with the owner 72 hours in advance. If other users will be affected, coordinate with owner/building management at the beginning of the project to find a workable solution.
- 21. Plumbing contractor shall provide shop drawings to the engineer for review and approval prior to beginning work.

Plumbing Fixtures, Equipment, & Accessories					
			Water Lin	e & Connec	ction Size
Description		Fixture Specification	CW	HW	W
Lab, Botox, Single Bowl		Sink Basin: Kohler #K-2882, vitreous china, undermount bowl. Dimensions 15"x19"x6 3/4" deep. Faucet: Pfister #LG42-TNT2K single handle faucet, Satin Brass finish, 1 hole faucet, 1.2 GPM flow rate. <u>Trap & Suppliers:</u> McGuire #8902, 17 gauge 1 1/4" x 1 1/2" P-trap and nipple. McGuire #LFB02angle supply stops. Mount P-trap such that ADA clearance requirements are maintained. <u>Accessories:</u> Truebro 82192 Lav Guard 2 molded insulation # 101-EZ, 3 piece interlocking trap assembly and 2 piece interlocking hot water angle valve assembly, with nylon type fasteners.	1/2"	1/2"	1 1/2"
Electric Water Cooler & Bottle filler		Elkay #EZSTL8WSLK dual level, ADA, wall mounted water cooler and and bottle filler; hermetically sealed and air cooled refrigeration unit. Electric push buttons on front and side with vinyl covered steel skirt and stainless steel hood receptor. Mount spout on lower side at 36" AFF and provide cane apron option on higher side of water cooler.	1/2"	-	1 1/2"
Wall Clean Out		Zurn #Z1446 wall cleanout tee, dura-coated cast iron body, gas and watertight ABS tapered thread plug, and round, smooth stanless steel wall access cover with securing screw.	-	-	see plans
Trap Primer		Watts #200 Flow through trap primer	1/2"	-	-
Shock Absorber		Watts series #15M2 water hammer arrestor, sized to match associated line. Shock absorber shall meet all requirements ASSE 1010, ANSI A1 12.261M as well as the 2018 NCSBC and the 2018 NCSPC, section 604.9	see plans	see plans	-
Vacuum Breaker		Watts #SD-3 vacuum breaker, sized to match associated line. Vacuum breaker shall meet all requirements ASSE 1022, as well as the 2018 NCSBC and the 2018 NCSPC, section 608.16.1.	<u> </u>	-	-

The intention of the depicted images above are to show the general appearance of the fixtures being specified. Exact representation is not necessarily shown nor are accessories for models or some variation of the model. The fixture specification should take precedent over the photo.

Demolition Note:

The existing locations shown on the demolition plan to be removed or relocated are for reference only and shall be field verified by contractor prior to beginning work. Any items required to be relocated or removed shall be included in contractor's cost, whether shown on this plan or not. Unless noted otherwise, where a fixture or device is noted to be demolished, the work shall include removing all associated piping, fittings, hangers, insulation etc. and shall include all patch, repair, paint or refinishing necessary to restore the location to match the surroundings. The contractor may reuse any existing piping, fittings, valves etc. where they have been inspected and are determined to be acceptable to the owner and/or are in like-new condition.

Renovation Notes:

- Contractor shall visit site to verify existing conditions.
- See architectural for scope of demolition work. Cap and/or plug all waste/vent lines installed during shell that will not be used for fitup. Confirm all capped piping will be concealed and/or will not conflict with new layout. Ensure that all waste lines being removed are plugged such that no sewer or gases will escape sanitary system.
- Contractor shall camera the existing under slab sewer piping prior to cutting concrete. Engineer shall be contacted if the existing lines are not in the location shown on plans or are not in proper working order.
- All new piping shall be concealed in walls, above ceiling, or below slab unless otherwise noted. Contractor shall verify that there is sufficient space above ceiling for all areas affected by new or demolition work.
- Any slab cutting for plumbing access requires soil compaction, vapor barrier and embedded #4 rebar dowels no less than 18" on center.
- Contractor shall reconnect any existing fixtures/piping to remain where the existing piping or surrounding area is affected by the new or demolition work by other trades.

General Notes:

- The domestic water for the building is protected by an existing 1-1/2" RPZ backflow preventer (Watts LF009). The backflow preventer is located in a hot box on site.
- Existing building water piping is copper. Contractor shall provide Type L annealed copper piping with 95/5 solder joints.
- Existing building water piping is copper. Contractor shall provide Type L annealed copper piping with 95/5 solder joints. All below grade water piping shall be Type "K" soft copper. Each complying with ASTM B-88.
- Contractor shall provide Schedule 40 PVC-DWV (conforming to ASTM D2665) fittings for S,W, & V indicated on plans.
- Contractor may run 3" waste pipe at 1/8" slope where 2 1/2" or smaller would be acceptable for the DFUs but not allow for the proper code required 1/4" sloping and fit in the given space.
- There is an existing hot water recirculation loop for this floor served by a 50 gallon, 4.5 kW, tank type water heater to remain.

Plan Notes:

- 1. Existing 1-1/2" tenant shut-off valve located in wall box to remain
- 2. Remove existing sink. Demo CW, HW, Waste, and Vent back to respective mains and
- 3. Remove existing drinking fountain. Prepare CW, Waste, and Vent connections from installation of new EWC in same location. Provide all necessary offsets and fittings to complete installation.
- 4. Existing 1/2" RPZ serving existing dental equipment to remain.
- 5. Connect to existing waste and vent from sink removed during demolition.
- 6. Connect new water cooler to existing connections from water cooler removed during demolition
- Provide solenoid operated emergency shut-off valve equal to JP Fluid Control DF-SA-series, 1-1/2" normally closed, 120V. Provide transformer for low voltage control for push button located in break room.
- Emergency shut-off valve for water service. Mount push button on wall, and connect to solenoid valve located in mechanical room.
- 9. Provide 1/2" angle stop stubbed out of floor for botox chair. Coordinate location with chair supplier prior to rough in. Route type M copper under slab.

Mechanical Notes and Specifications

General Requirements:

1. The heating and air conditioning contractor (the contractor) shall provide all specified and miscellaneous material and labor as required for a complete and operating system as described by these plans and

recommendations of the manufacturers. If there is a conflict in the above requirements, the more stringent

4. Prior to bidding, the contractor shall visit the site to familiarize themself with existing conditions and resolve

5. All ductwork and equipment shown on these drawings is strictly diagrammatic. All ductwork sizes shown are free area sizes. It shall be the responsibility of the contractor to ensure that items furnished under this contract will fit in the space available. The contractor shall make necessary field measurements to

equipment that are the true intent and meaning of these drawings and specifications. Any conflicts shall be 6. Prior to construction, the contractor shall coordinate their work with all other trades. All drawings indicate

variances are required. The drawings do not show all bends, offsets, and fittings that may be required for the complete execution of this contract. Such variances and contingencies shall be allowed for in the contractor's bid and shall be accomplished without additional cost to the owner. Prior to ordering equipment, the contractor shall prepare coordination drawings showing how their equipment is to be located in the space indicated. This drawing shall show the new and existing work of all other trades. The contractor shall contact the other contractors involved for dimensions, locations, and required clearances

8. All equipment shall be located and installed to provide maximum space for maintenance and service. 9. All materials used shall be new and free of defects. Where trade names are mentioned, they are given as a reference to the quality of the apparatus required. All materials and equipment shall bear the UL label or equivalent where applicable. Other makes may be used if approved in writing by the engineer. Provide a complete list of materials and equipment proposed for use in this contract to the engineer within ten days following the award of contract. If such list is not submitted, the contractor shall supply the materials and equipment specified or as directed by the engineer. The contractor shall provide digital copies of submittals

10. Workmanship shall be first-class and performed by experienced and skilled craftsmen.

requirements. Furnish a final copy of all testing, adjusting, and balancing reports as a part of the operating and maintenance manuals. Indicate deficiencies preventing proper testing, adjusting, and balancing of systems and equipment to achieve specified performance. Adjust air handling systems to within plus or minus 10 percent of design. Adjust total air to all air outlets and inlets to within plus 10 percent and minus 5 percent of design to space. Adjust individual outlets and inlets in space to within plus or minus 10 percent of design. Adjust air handling and distribution systems to obtain required or design supply, return, and exhaust air quantities. Measure air quantities at air inlets and outlets. Vary total system air quantities by adjustment of fan speeds. Provide sheave drive changes to vary fan speed if required. Vary branch air quantities by damper regulation. Measure static air pressure conditions on air supply units, including filter and coil pressure drops, and total pressure across fan. Make allowances for 50 percent loading of filters. Adjust outside air automatic dampers, outside air, return air, and exhaust dampers for design conditions.

13. As applicable, the contractor shall verify the operation of all existing mechanical equipment in the area of work. All measurements shall be recorded necessary to ascertain the proper operation of the equipment including, but not limited to, amperage, gpm flow, inlet and outlet temperatures, airflow, and inlet and outlet static pressures. Any deficiency in the rated output of the equipment shall be reported to the engineer. In any case, said report shall be submitted to the engineer upon request.

14. All equipment shall be provided with permanent labels for identification. All pipe shall be labeled to indicate pipe function and direction of flow. Provide valve tags for all valves. Coordinate nomenclature and

15. The contractor shall furnish a bound set of operating and maintenance instructions for all equipment to the

materials, equipment, and fixtures in their contract to leave such items bright and clean. The contractor shall keep the premises clear of debris from their work during construction and leave the area and building

17. Mechanical and electrical equipment shall operate without objectionable noise or vibration, as determined by the engineer. If such objectionable noise or vibration should be produced and transmitted to occupied portions of the building, the contractor shall make the necessary changes to correct the noise or vibration

18. The contractor shall provide a complete 1-year warranty on all labor and materials under this contract. Refrigeration compressors provided under this contract shall carry the manufacturer's published 5-year

19. The electrical contractor shall be responsible for all power connections to the equipment provided under

20. The mechanical contractor shall be responsible for all control wiring for their equipment.

23. Contractors and sub-contractors shall carefully review the construction documents. Information regarding

with foam insulation. Provide long line refrigeration kit as required.

float switch that stops the fan upon accumulation of condensate in the pan. Locate all equipment above the ceiling so that adequate slope is provided for all drain lines. If a condensate pump is specified, extend the auxiliary drain pan under the condensate pump. Condensate drain lines in return air plenums shall be made of type 'K' copper pipe. Insulate drain lines to prevent sweating. Route condensate drains as directed

• All sheet metal ductwork, unless otherwise specified, shall be constructed of galvanized steel sheets in accordance with SMACNA gages and standards. Duct shall be constructed for 1" static pressure and sealed to SMACNA Classification "B". Insulate all ductwork, unless otherwise noted, with foil-faced 1 psf density fiberglass duct wrap. Insulation R-value shall be per the 2018 NC Energy Conservation Code. For rooftop equipment, line the supply and return duct to five feet beyond first elbow downstream of the discharge and intake of the unit. Duct liner shall be 1" thick, 1.5 pound density acoustical liner.

Materials and Equipment:

Flexible Duct:

Ductwork

- Shall be insulated, sound attenuating, low velocity type, and shall comply with NFPA 90A and 90B. Flexible duct shall bear the UL Class 1 air duct label as tested under UL 181. Flexible duct shall be factory-formed, composed of spiral wound corrosion resistant wire bonded to an inner fabric liner. Duct shall be factory insulated with a foil vapor barrier jacket. Insulation R-value shall be per 2018 NC Energy Conservation Code
- The installation of flex duct shall conform to the requirements of Chapter 3 of the SMACNA HVAC Duct Construction Standards, (latest edition). Bends in flexible duct shall not be less than two duct diameters centerline radius and bends shall not begin within three inches of a sheet metal connection. Duct shall not be compressed. Support duct from the structure at intervals not to exceed ten feet. Maximum permissible sag is 1/2 inch per foot of spacing between supports. Hanger or saddle material in contact with the duct shall be wide enough so that it does not reduce the internal diameter of the duct when the supported section rests on the support and in no case shall be less than 1" wide.

Duct Elbows:

Use full-radius elbows or square bends with turning vanes.

System Balancing:

 Provide locking guadrant type manual volume damper at each flexible duct runout. Provide splitter lampers at supply tees and extractors at all supply air branches. Provide balancing dampers in all ducts where required for system balancing as shown or as required.

Air Distribution

Provide all grilles, registers, and diffusers per the schedule on the drawings. Provide support from the structure for each diffuser and damper installed in a lay-in ceiling. Linear slot diffusers shall be constructed so that each slot may be independently configured to insure a full 180° air control pattern. The contractor shall coordinate finish styles and colors with the architect prior to ordering equipment. The backs of all air distribution shall be insulated from unconditioned space.

Fire Dampers:

• The contractor shall provide fire dampers at all duct penetrations of rated walls as indicated on the drawings or where required by the authority having jurisdiction. Fire dampers shall be UL labeled, Style "B" curtain type, and dynamically rated with integral factory sleeve. Blades shall be located out of the airstream for minimum airflow restriction. Installation shall be in accordance with the SMACNA Fire, Smoke and Radiation Damper Installation Guide for HVAC, (latest edition). Provide suitable access door for testing and servicing damper mechanism. Prior to completion of job, the contractor shall test each damper for proper operation and make adjustments as necessary.

Flexible Duct Connections:

• Furnish and install flexible duct connectors on supply and return connections of all air handling units. Escutcheons

• Furnish and install escutcheons in all places where piping or mechanical equipment penetrates a finished wall or ceiling in an exposed location.

Smoke Detectors:

 The Mechanical Contractor shall provide smoke detectors per the 2018 NC Mechanical Code, Section 606.2.1. Smoke detectors shall be UL listed for duct installation and be located in the return airstream to shut down the supply air fan upon activation. The system shall be wired so that the fan immediately shuts down upon a signal from the detector and bypasses any built-in time delays. The mechanical contractor shall furnish, install, and wire all smoke detectors per the manufacturer's recommendations. The smoke detectors shall be capable of interconnectability for multi-fan shut down and shall be wired so that activation of any detector will shut down all supply air fans on the project. Each detector shall be provided with a visible and audible signal located to indicate general location of smoke origins per the NC Mechanical Code, Section 606. Each detector shall also be provided with a trouble signal and shall be labeled.

Access Panels:

• The Mechanical Contractor shall provide access panels as required for access to valves, dampers, controls, or any other item installed under this contract where such item is concealed behind construction which renders the item inaccessible for service or adjustment. Said access panels or doors shall be fire rated as necessary to maintain the integrity of the construction wherein the panel or door is installed. HVAC Equipment:

All equipment shall bear the UL, CSA, met or other accredited testing laboratory label where appropriate. All equipment shall conform to the type, size, rating, and performance of that listed on the drawings under this contract. Submit shop drawings per the specifications.

Control Wiring:

All control wiring shall be run in a metallic raceway. Raceway shall be routed parallel and perpendicular with the building structure. The metallic raceway may be omitted where plenum-rated cable is installed above an accessible ceiling within the building envelope. There shall be no splices in the control system wiring other than at terminal blocks. Wire nuts and crimp splices are not permitted.

Refrigerant Piping:

All refrigerant piping shall be copper, sized per HVAC equipment manufacturer's recommendations. all piping shall be insulated per 2018 NC Energy Conservation Code. All insulated piping exposed to weather shall be coated with Armaflex "WB" finish or equivalent. Piping installed subject to being damaged shall be provided with UV-resistant PVC jacket.

General Notes:

- The contractor shall comply with all requirements of the 2018 NC Mechanical Code with regards to all mechanical work.
- 2. The Mechanical Contractor shall coordinate the installation of all equipment, piping, and ductwork under this contract with the building structure. Contractor shall make adjustments where necessary without additional cost to owner.
- 3. Coordinate all supply, return, and exhaust grille locations with architectural reflected ceiling plan.
- 4. Where ducts and/or equipment are shown crossing, the larger duct or equipment shall take precedence. The contractor must provide transitions so that the smaller of the ducts is routed up and over the top of larger ducts.
- 5. The Mechanical Contractor shall inspect the existing ductwork prior to bid. Verify duct sizes and locations and new duct routing. Repair insulation and patch ductwork as necessarv.
- 6. Relocate existing thermostat and/or temperature sensor devices as shown on mechanical plans. Replace devices where necessary. Verify that all new and existing device locations are acceptable to owner/tenant prior to construction. 7. Reuse diffusers and grilles from demolition phase where possible. Clean and replace
- as necessary 8. No new heating or cooling has been added as a part of this project. No energy code
- summary is required.
- 9. Insulate all new supply, return, and outside air ductwork with exterior duct wrap.

REVISIONS DESCRIPTION

DATE

Plan Notes:

1. Install relocated wall mounted thermostat at location indicated. Relocate duct detector keyed test / shut down high on wall above thermostat.

Demolition Notes:

- 1. Demolish spin-in tap, runout, and diffuser as indicated. Patch and insulate remaining duct.
- 2. Demolish duct mounted return grille as indicated. Patch and insulate remaining duct.
- 3. Demolish exhaust fan and duct up through roof. Coordinate patching of remaining
- opening in roof with the General Contractor or cap from below within attic.
- 4. Remove thermostat. Thermostat shall be relocated during construction phase.

Wall Ratings and Types Legend

See architectural sheets for more information on ratings and additional rated constructions including structure where applicable. Protect all rated constructions as required.

These drawings will be at the scale indicated when plotted at 24" x 36"

GENERAL NOTES AND REQUIREMENTS.

- requirements.
- of electrical equipment, so as to avoid conflicts during construction and to allow for optimum maintenance and working space.
- labeled and conduit shall be labeled every 10'.
- no other derating conditions exist. sizes. Minimum conductor size shall be #12.
- size adiustment.
- make the final connection required.
- Coordinate closely with other trades.

- continuity prior to energizing.
- etc. prior to beginning any work. found, contact engineer immediately
- time incurred to prepare them.
- application and materials. NEC 300.19(A).

automation shall be labeled per NEC 406.3(E).

1. Workmanship shall conform to NECA installation standards including NECA 1. 2. Installation shall comply with National Electrical Code (NEC/NFPA 70), state building code, and all requirements of the local inspector (furnish inspection certificate). All work shall be by licensed electrical contractor. 3. The contractor shall refer to the architectural plans for floor plan dimensions and not scale these drawings. The location of all wall mounted devices, including mounting heights, shall be field verified with the architect prior to rough-in. Coordinate locations of all light fixtures with the reflected ceiling plans. Light fixtures installed in mechanical areas shall avoid mechanical piping, equipment, ductwork, etc.

4. Contractor shall comply with all requirements of the 2018 NC Building Code and Accessibility Code which are applicable to this project regardless of whether all details are indicated on plans. All receptacles, switches, and other electrical devices required to be ADA accessible shall be mounted per ANSI 117.1 sections 308 AND 309. 5. All electrical equipment shall be installed so that all code required and manufacturer recommended working/ servicing clearances are maintained. Installation shall fully comply with NEC 110.26 and NEC 408.18 for clearance

6. All wall outlet boxes, receptacles, switches, cover plates, etc. shall be commercial grade, standard or heavy duty except where specified. Verify color/ material for all devices and cover plates prior to order. Provide label for each device identifying the circuit serving the device. Verify if label should be on inside our outside face of cover plate with building management/ tenant. All 15 and 20 amp, 125V and 250V non-locking receptacles shall be listed as tamper resistant, per NEC 406.12, when installed in the following areas: dwelling units in areas specified by NEC 210.52 and 550.13, guest rooms and suites of hotels, child care facilities, preschool and elementary education facilities, and in patient rooms, bathrooms, playrooms and activity rooms of pediatric or similar facilities. 7. The electrical contractor shall coordinate any and all work with other trades involved in the project, prior to installation

8. All branch circuits shall be in 3/4" minimum zinc-coated EMT, IMC, or RMC as permitted or required by the NEC. LFMC (or FMC as permitted) shall be used for final connections to equipment subject to vibration. A deduct price for MC cable may be offered for approval, where permitted by owner and NEC and conduits completely concealed from view. Schedule 40 PVC conduit may be used for underground feeders/ branch circuits or underground low voltage system conduits located below slab on grade or buried outside of the building, or in concrete block walls. PVC schedule 80 conduit may be used on the building exterior where permitted by code. Contractor shall include cost of painting all exposed conduits subject to public view. Conduit sizes noted on these plans are based on EMT conduit. Where other permitted raceway types are used, contractor shall adjust conduit sizes as necessary based on type of raceway used and allowable fill. Provide pull wire in all empty conduit. Junction box covers shall be permanently

9. All wire and conduit sizes are based on 75° C THHN/THWN copper conductors unless otherwise noted. All conductors, terminations & devices shall be rated for minimum 75°C. All conductor and conduit sizes are calculated based on installation of no more than 3 current carrying conductors per conduit, neutral(s) included. Unless otherwise noted, contractor shall not install more than 3 current carrying conductors per conduit with the following exception: up to 9 current carrying conductors may be used in a single raceway where permitted by the NEC when minimum #12 AWG (THHN 90°c) is used and when all included circuits are protected upstream by 20 amp overcurrent devices and

10. All conductors shall be copper type THHN, or XHHW, solid for #10 AWG or #12 AWG, and stranded for all larger 11. Conduits and cables shall be concealed wherever possible by either routing above ceiling, in interstitial spaces or

running exposed in unfinished spaces where possible. Conduits may be run exposed in mechanical areas or other areas not subject to public view where approved by the owner. Wherever conduits or cables are approved to be exposed, conduits and cables shall be run parallel or perpendicular to structural elements and shall be run and bundled in groups, and the installation shall be neat and orderly. Even when exposed, conduits and cables shall be routed to minimize view from personnel. Seal all penetrations air tight around all conduits passing through walls or floors. Use appropriate penetration protection when conduit passes into or through rated assemblies. 12. Where branch circuit total length is greater than sixty five (65') feet from the panel, see voltage drop schedule for wire

13. All mounting heights indicated are given to the bottom of the device, unless noted otherwise. 14. Where used in these documents, the word "provide" shall mean to furnish and install the item or equipment as well as

15. All light fixtures shall be supported independently of the suspended ceiling system. 16. The electrical contractor shall provide all necessary disconnects, switches, receptacles, etc. under the electrical bid and shall include all necessary circuits to and make final connections to the equipment furnish by all suppliers.

17. All breakers, disconnect switches, and fuses sizes, indicated for mechanical equipment, shall be verified with equipment supplier and mechanical contractor, before the purchase or installation of that equipment. 18. All disconnect switches are to be fusible type. Fuses shall be the appropriate type for the load served by Bussmann or equal. Unless unsuitable, fuses rated 1200A or higher shall be Class I, fast-acting, and shall have a clearing time of 0.07 seconds at the available fault current per NEC 240.67. Submit fuse trip curves along with available fault current at the service entrance for engineer verification prior to beginning work or ordering equipment. The contractor shall compare all installed equipment nameplate information with the electrical plans/ schedules and notify the engineer immediately of any discrepancies. The contractor shall coordinate all fuse sizes with actual installed equipment nameplate information prior to purchasing or installing fuses. Where the nameplate information does not indicate an overcurrent protection size or maximum ampacity rating, fuses shall be installed per the electrical plans assuming other equipment parameters are in agreement with nameplate data. 19. Provide grounding conductor for all circuits per NEC. Building ground shall meet all requirements of NEC 250.

20. Ground telephone equipment per NEC. If telephone service is not located within 20' of electrical service, then provide separate grounding electrode as required per NEC 800.

21. All multiwire branch circuits shall have multipole breakers as required by NEC 210.7. 22. All circuits 100 amp and larger shall be megger tested prior to energizing. All other circuits shall be tested for

3. The electrical contractor shall patch any wall, ceiling, or floor opening (or penetration) resulting from demolition or new work in existing areas. Any rated constructions or assemblies affected shall be patched, protected and refinished as necessary to maintain the original appearance as well as the rating.

24. The contractor is responsible for properly disposing of all waste materials, demo materials and other trash. This includes but is not limited to proper disposal of mercury containing lamps, batteries, recyclable materials. 25. Contractor shall provide engineer with shop drawings/ submittal data for lights, switchgear/ panels, floor boxes, fire alarm devices, and any other products deemed necessary for review. Provide these in editable pdf format via email through project manager, GC, architect or other proper channel. Expected review duration, and industry standard, is 2 weeks from date of receipt by engineer. All submissions should include and acknowledge this review duration unless otherwise specifically discussed and agreed upon in advance.

26. It is the sole responsibility of the contractor to coordinate w/ all other trades regarding voltages, loads, circuit breakers, 27. All switchgear/ panels shall be commercial grade from a reputable national manufacturer such as Square D, Eaton, Siemens and GE. Panels shall be rated as indicated on panel schedules/ electrical riser diagram. If discrepancies are

28. Engineer has reserved the right to choose the software package(s) deemed most efficient to deliver these plans for permitting, bid, and construction. Engineer considers any other digital files created during this process as instruments of service, and as such remain the property of the engineer. The contractor should not assume that digital files in any format will be made available during bidding or after award other than PDFs. If digital files are requested, engineer reserves the right to selectively provide them when available and/or may request additional considerations for the

29. Contractor shall verify all areas that are used as a return plenum with mechanical contractor and provide plenum rated cable for all cables not run in metal conduit. PVC is not allowed in plenum space. This "cable" includes all telecommunications, fire alarm, or control wiring above ceiling.

30. Contractor shall comply with all applicable seismic requirements of the area. 31. All underground raceway entering the building, (i.e. through a foundation wall or through the floor) shall be sealed in accordance with NEC 225.27 and 300.5(F). raceway seals and sealants shall be approved and listed for the specific

32. Contractor shall provide support bushings/conduit stops for vertical branch circuits and feeders where required per

33. If existing building is equipped with a Bi-Directional Antenna system (BDA), contractor shall test the areas of construction before and after construction activities per NC Fire Code section 510.6.1 and possibly supplement the

existing system to meet the requirements of NC Fire Code section 510. 34. Electrical boxes, conduit, and wiring shall not be recessed into or penetrate structural members. Boxes/conduits shall be surface mounted to structural member and/or recessed in stud wall where possible. Coordinate with architect. 35. All equipment associated with or connected to the electrical, fire alarm or data systems or otherwise included in the drawings/ scope of work shall be listed and labeled by a third party that is acceptable to the AHJ. 36. All non-locking type 125 volt, 15 and 20 amp receptacles that are controlled by an automatic control device or that incorporate control features that remove power from the outlet for the purpose of energy management or building

Renovation Notes:

1. See architectural drawings for the extent of renovations. Locations where an existing ceiling is being raised, or a new ceiling is being installed, the contractor shall include all costs associated with relocating existing devices and systems components necessary to accommodate the installation of the new ceiling. This shall also include relocating any equipment requiring access when a new or changed ceiling does not provide access (hard ceiling).

2. Contractor shall field verify existing conditions prior to bid.

- Reconnect circuits as shown on plans. Devices/fixtures shown to remain shall remain connected to their existing circuit. If circuit is broken during demolition, device/fixture shall be reconnected to existing circuit as necessary for complete and working system. Portions of circuits or circuits in their entirety broken during demolitions shall be removed (conductors and conduit). If the entire circuit, remove conductors and conduit back to panel, turn breaker off and mark as spare.
- 4. Existing light fixtures shown without circuits or controls are existing to remain as circuited and/or controlled. Existing fixtures shown with new circuitry or controls shall be connected and/or controlled as indicated.
- 5. If existing panel serving existing to remain equipment is demolished or relocated, the existing to remain equipment shall be reconnected to relocated or new panel as
- 6. Clean all existing light fixtures to remain and replace defective parts as necessary for a complete and functional fixture (IE driver/ballast, battery, lens, etc). Relamp if necessarv
- 7. Test all existing emergency batteries in fixtures and/or in emergency battery units in the space. Replace defective batteries.
- Mount all new switches, outlets, or other electrical devices flush in existing walls. Boxes and conduit shall be concealed

Demolition Note:

The existing locations shown on demo plan to be removed or relocated are for reference only and shall be field verified by contractor prior to beginning work. Any items required to be removed or relocated shall be included in contractor's cost, whether shown on this plan or not. Unless noted otherwise, where a device or fixture is noted to be demolished, the work shall include removing all associated boxes, conduits, hangers, conductors, cables etc. and shall include any patch, repair, paint or refinishing necessary to restore the location to match the surroundings. The contractor may reuse any existing conductors, boxes etc. where they have been inspected and are determined to be acceptable to the owner and/or in like-new condition.

Sheet Notes:

- All electrical boxes mounted in rated walls shall comply with all requirements of the 2018 NCSBC, section 714.3.2. All electrical boxes mounted in rated ceilings/horizontal assemblies shall comply with all requirements of the 2018 NCSBC, section 714.4.2. Devices shown in rated assemblies shall be flush with conduit concealed, unless otherwise indicated. Provide rated boxes, horizontal separation, putty pads, etc. as required for proper installation. Low voltage electrical devices mounted in rated assemblies shall be protected in accordance with the sections listed above as well.
- Individual branch circuits are shown with a dedicated neutral unless otherwise noted. When multi-wire branch circuits are to be installed, provide multi-pole circuit breakers as required. NEC 210.7
- See voltage drop schedule for wire sizing information for all branch circuits over 65' in length.
- All receptacles within 6 feet from the outside edge of any sink shall be GFCI. NEC 210.8(B)(5). All GFCI trip-reset receptacles shall be readily accessible. NEC 210.8.
- All 120V, 15 and 20 A receptacles in this facility shall be listed as tamper resistant.
- EC shall evaluate existing wire serving medical areas and replace where necessary with wire run in metal conduit or medical grade MC cable and shall have an insulated copper equipment grounding conductor as required per NEC 517.13

Plan Notes:

- 1. Flush floor box for power for exam chair. See legend for specification. Connect as required. Coordinate exact location with tenant.
- 2. Connect solenoid operated valve as required. Coordinate with plumbing.

Medical Notes:

- This facility is a medical facility and shall comply with all applicable requirements of NFPA 99 and NEC article 517.
- 2. All circuits serving patient care spaces or patient care vicinities shall be run in metal conduit or medical grade MC cable and shall have an insulated copper equipment grounding conductor as required per NEC 517.13.
- This facility is a general care facility and will not be used as a critical care facility per NEC 517.2. This facility will not employ the use of life support equipment (per NEC 517.45B), or wet procedure locations (per NEC 517.2). This facility is required to have ial electrical systems per NFPA 99 and therefore does not require separate branches or emergency lighting considered essential for life safety and orderly cessation of procedures if normal power is lost (per NEC 517.25). No emergency power systems are required by the previously mentioned codes and are therefore not shown on these drawings. There are no anesthetizing locations in this facility per NEC 517.2. No patients receives anesthesia that would keep them from being able to immediately get up and leave the facility under their own power in the event of an emergency.
- 4. All low voltage wiring in patient care spaces or vacinities shall provide equivalent insulation and isolation to that required of the electrical power distribution system per NEC 517.80.
- 5. All panelbaords serving this tenant space shall be bonded together as required per NEC517.14.

E1.1

These drawings will be at the scale indicated when plotted at 24" x 36"

Demolition Note:

The existing locations shown on demo plan to be removed or relocated are for reference only and shall be field verified by contractor prior to beginning work. Any items required to be removed or relocated shall be included in contractor's cost, whether shown on this plan or not. Unless noted otherwise, where a device or fixture is noted to be demolished, the work shall include removing all associated boxes, conduits, hangers, conductors, cables etc. and shall include any patch, repair, paint or refinishing necessary to restore the location to match the surroundings. The contractor may reuse any existing conductors, boxes etc. where they have been inspected and are determined to be acceptable to the owner and/or in like-new condition.

Sheet Notes:

- All electrical boxes mounted in rated walls shall comply with all requirements of the 2018 NCSBC, section 714.3.2. All electrical boxes mounted in rated ceilings/horizontal assemblies shall comply with all requirements of the 2018 NCSBC, section 714.4.2. Devices shown in rated assemblies shall be flush with conduit concealed, unless otherwise indicated. Provide rated boxes, horizontal separation, putty pads, etc. as required for proper installation. Low voltage electrical devices mounted in rated assemblies shall be protected in accordance with the sections listed above as well.
- Connect wall packs or other normally off emergency lights, exit signs and night lights ahead of local switches and/or controls. (total fixture unswitched). Where lights are not indicated as night lights, fixtures with emergency batteries shall be connected with the battery ahead of switch so that the emergency battery comes on only in the event of power loss. Fixture is normally controlled with the other lights under normal conditions. • See motion sensor details for specifications and wiring details.
- Lighting controls including occupancy sensors, automatic time switches, automatic shut-off controls, or daylight/ occupant sensing automatic controls, the electrical contractor shall be responsible for testing the lighting controls per section C408.3 of the 2018 NC Energy Conservation Code. Ensure that control devices, components, and systems are calibrated, adjusted and operate in accordance with the approved plans and/or specifications. Sequences of operation shall be functionally tested to ensure they operate in accordance with the approved plans and/or specifications.
- Individual branch circuits are shown with a dedicated neutral unless otherwise noted. When multi-wire branch circuits are to be installed, provide multi-pole circuit breakers as required. NEC 210.7
- See voltage drop schedule for wire sizing information for all branch circuits over 65' in length.
- Contractor may reuse existing emergency/ exit light, given that the device is in proper working order and it matches the established standard for the space. Replace chevrons and rotate as shown on plans.
- Exam rooms shall not require additional controls per 2018 NC Energy Conservation Code C405.2.2 Exception 3.

Plan Notes:

- 1. Connect emergency and exit lights ahead of local switch/controls so that total fixture is unswitched. Connect as required.
- 2. Existing emergency and/or exit light to remain. Confirm proper operation and replace if necessary. Provide line item price for replacement in base bid in the case that replacement is necessary.
- 3. Motion sensor to control all lights in this room. See motion sensor wiring diagrams. Provide required power packs to control all lights with override off switches as shown. Typical.
- 4. Contractor shall reconnect remaining or relocated lights to existing 120V circuit currently serving those lights. No new lights are being added to these circuits, just being relocated and/or reswitched. If multiple branch circuits are utilized in new configuration, contractor shall verify the total wattage on any circuit does not exceed 1,920 watts.
- 5. Connect to circuit 'PP3-38' with other lights as required.

All fixtures and components shall comply with NC Building Code, 2018 North Carolina Energy Conservation Code and shall be UL listed. All led drivers shall comply with NEMA 410. All new, relocated, or reswitched fixtures that utilize ballasts shall be provided with a luminaire disconnect where required per NEC section 410.130(G). Use Ideal PowerPlug or equal inside fixture.

2.

3. All fixtures noted as emergency shall have emergency illumination functionality as described below. Batteries must be rated for the environment in which they are installed, in all cases. • Interior linear led and fluorescent fixtures shall have 1,100 lumen (minimum) output, 90 minute battery. Led and fluorescent downlights shall have a 500 lumen (minimum) output, 90 minute battery.

Otherwise fixture shall be provided with a full output inverter. • Exterior emergency fixtures shall have an integral exterior rated (0° F) or remotely mounted 1,100 lumen (minimum) output, 90 minute battery. • Test switches for emergency batteries/inverter shall be integral to the fixture/device served, unless otherwise noted. • Emergency fixtures shall operate at least one lamp where multiple emergency fixtures are to be installed in that area, and shall operate at least two lamps where the loss of a single lamp would leave the space in total darkness during emergency operation.

• Where emergency lights provide emergency illumination in areas normally illuminated by metal halide fixtures (or similar) with restrike delay, the emergency battery shall be provided with a minimum 15 minute time delay to maintain battery illumination after the restoration of normal power. • Emergency lighting design is based on fixtures lumen outputs as described above. Contractor shall verify all existing emergency batteries to ensure lumen outputs are as indicated and shall replace any

batteries rated less outlined above. • Emergency lighting units with dedicated emergency heads are spaced based on their unique output. If contractor selects an alternate fixture, they are responsible for ensuring an average of 1 fott candle is provided along the paths of egress for at least 90 minutes.

Lamp color temperature for new lamps shall match existing to remain lamps, and all lamp colors for different fixture types and sources shall be consistent throughout the space or area unless specifically noted 4. otherwise. Contractor shall ensure that all interior and exterior lamps are the same color temperature.

5. Light fixtures indicated as dimmable shall be provide with all necessary components (driver, switch etc.) necessary to achieve 5% minimum dimming unless another specific minimum dimming level is noted.

Statement:				
st of my belief, understanding, and knowledge; the design of electrical this building complies with the NC State Building Code and the 2018				

Name: Richard D. Copeland, Jr. PE

Panel Schedule Notes (All Panels, All Sheets):				
1.	All panel directories shall be completed in accordance with NEC 408.4.			
2.	Values for demand loads include all code factors such as 125% for continuous loads, 125% largest motor, etc.			
3.	Breaker sizes shown in panel schedules for new equipment are for reference only, see equipment connection schedule for additional information. Where breaker / fuse size between schedules conflict, the equipment connection schedule shall take precedence. Contractor shall ultimately confirm breaker size with equipment provider			
4.	Circuit breakers used as overcurrent protection for HVAC equipment shall be "HACR" type.			
5.	Contractor shall provide identification for new feeders and any new branch circuits per NEC 200.6, 210.5, and 215.12.			
6.	Contractor shall label breakers feeding emergency and exit lighting per NEC 700.12(F).			
7.	Provide arc flash hazard warning labels as required on all panels affected by this work to comply with NEC 110.16.			
8.	Where circuit breakers or fuses are noted to be series rated, the equipment shall be listed per NEC 110.22 as applicable. Tested series combination systems, the placard shall state the following "Caution - Series Combination System Rated Amperes. Identified Replacement Components Required." See NEC 110.22(b), for engineered series combination systems placarding language.			
9.	Bolded text indicates a new or changed breaker, label, load on an existing panel. Bolded breakers are new or relocated breakers to location shown.			
10.	Contractor shall provide handle ties as required for cubicle circuits per NEC 605.7.			
11.	Contractor shall provide multipole breakers in place of all single pole breakers shown, when multiwire branch circuits are installed per NEC 210.4(B).			
12.	New circuits in locations determined to be spare or space based on panel directories and other available information from site visit or existing plans. Contractor shall confirm that placement shown does not interfere with existing circuits necessary to remain. Confirm available circuits based on new and demo plans and contact engineer with conflicts.			
13.	Breakers indicated as (L) shall have a breaker lock provided. 20/1(L) means a 20 amp single pole breaker with lock. Breaker lock shall be accessible from outside of panel and shall not require the removal of panel cover in order to reset the breaker.			

cover in order to reset the breaker. 14. Breakers indicated as (G) shall have GFCI protection provided. 20/1(G) means a 20 amp single pole breaker with GFCI protection.
