Dear Mr. Davis,

A site investigation was conducted on 28 July 2022 for the above referenced property, which is located on the eastern side of Fairground Road (SR 1705) in Harnett County, North Carolina. The purpose of the investigation was to determine the ability of this lot to support a subsurface sewage waste disposal system and 100% repair area for a typical four-bedroom home. Public water supplies will be utilized for this lot. At the time of investigation, the property boundaries were not well marked. This will likely be required in order to receive the permit and properly install the septic system. The house footprint that was marked at the site did not appear to meet regulatory setbacks and needs to be re-staked in accordance with the attached plan. A second option is provided for the house site, please decide which you prefer and it needs to be staked at the site. If you need our assistance, please let us know.

All ratings and determinations were made in accordance with "Laws and Rules for Sewage Treatment and Disposal Systems, 15A NCAC 18A .1900". This report represents my professional opinion but does not guarantee or represent permit approval for any lot by the Local Health Department. The permit you receive from the Local Health Department may contain some modifications or amendments to our submitted design. Please carefully review your permit and adhere to all prescribed requirements.

SOIL INVESTIGATION

The soils were evaluated under moist soil conditions through the advancing of auger borings. A portion of this lot was observed to be underlain by soils rated as provisionally suitable for subsurface sewage waste disposal (Figure 1). These provisionally suitable soils were observed to be firm sandy clay loams to greater than 33 inches and will support long term acceptance rates of 0.4 gal/day/sqft. The unsuitable soil area is so rated due to inadequate soil depth to excessive soil wetness conditions.

SEPTIC SYSTEM DESIGN

The proposed single family residential home will contain three bedrooms and generate a design flow of 360 gallons per day (Figure 2). A 1000 gallon (minimum) septic tank is required with an approved effluent filter. The addition of a 1000-gallon pump tank will be necessary to pump effluent uphill to the proposed drainfield.

The initial septic system is proposed as a pump driven system to 300 linear feet of low profile chamber drainlines (Figure 2). A long-term application rate of 0.4 gal/day/ft² was used to design both the drainfields. A distribution box will be used to deliver effluent in serial distribution to five unequal length drainlines. The drainlines may need to be installed slightly off contour with maximum trench bottom depths at 13 inches below surface. Due to the ultra-shallow trench depth, it will be necessary to add native backfill over the nitrification field to provide at least six inches of cover over the drainlines.

The repair septic system is also proposed as a pump driven system to 150 linear feet of horizontal permeable panel block drainlines utilizing a 50% reduction in total drainline length. A distribution box will deliver the effluent in parallel distribution to two 75 foot drainlines. The drainlines may need to be installed slightly off contour with maximum trench bottom depths at 18 inches below surface.

All regulatory setbacks for a septic system shall be maintained. Drainlines must be installed at least 9 feet apart on center. The septic system (including tanks) must be at least 10 feet from a property line, 5 feet from a home, 50 feet from a surface water, and 100 feet from an individual well (50ft for repair systems).

Potential septic system drainlines have been demonstrated with various colored pin flags that are located on the lot. It is important to protect the areas designated for installation of the septic system or repair area from all land disturbing activities. It is recommended that a staked line or protective fence be placed around the system prior to construction to eliminate any potential damage to the soil or the layout of the system.

SYSTEM MAINTENANCE

It is recommended that care be taken to preserve the life of your septic system. The septic tank, pump tank, and distribution boxes should be kept accessible for pumping and adjustment. Your septic system should be inspected periodically and the septic tank pumped out every 2 to 5 years by a professional contractor. Practicing water conservation in the home, such as promptly repairing leaky fixtures and running washing machines and dishwashers only when full, will help to avoid overloading the septic system. Also, disposal of oils, fats, and grease into the septic system should be avoided because they could clog drainlines and conveyance pipes. A list of other useful suggestions can be found at <https://content.ces.ncsu.edu/septic-system-owners-guide>

It is required that the nitrification field and repair area be protected from vehicular traffic or other unauthorized access. Vehicular traffic can damage soils, pipes, and valve boxes. Damage to the nitrification field or repair area could result in the septic permit being revoked.

CONCLUSION

This report and the attached septic system design information will need to be submitted to the Local Health Department for review and the permitting process. I appreciate the opportunity to provide this service and hope to be allowed to assist you again in the future. If you have any questions or need additional information, please contact me at your convenience.

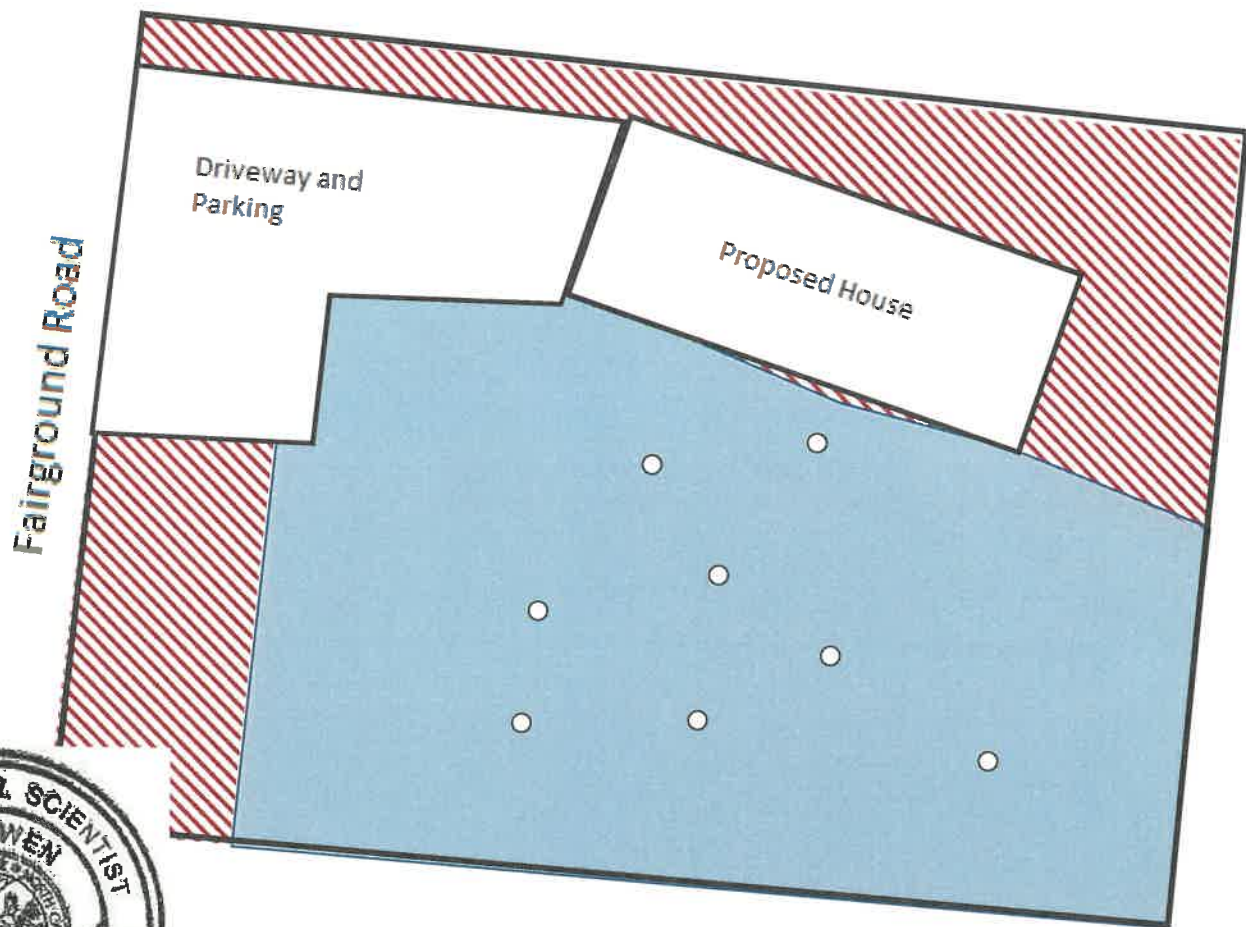

Sincerely,

A handwritten signature in cursive script that reads "Hal Owen".

Initial System

Pump to 1 X 300 ft (X3ft)
 Low profile chamber drainlines (Lines 3-7)
 Installed off contour, MTD 13 inches
 LTAR 0.4 gpd/sf

Repair System

Pump to 2 X 75 ft (X3ft)
 Permeable Panel Block drainline (Lines 1-2)
 Installed off contour, MTD 18 inches
 LTAR 0.4 gpd/sf

*drainlines must be at least 9ft on center,
 10ft from property line, 5ft from home,
 50ft from wells, 10ft from a water line,
 and 3ft from sidewalks and driveway
