Roof Structural Assessment

CDR+A Structural Engineers

- **Analysis of Roof Structure A:**
  - Additional dead load 15 psf (12 psf from roof + 3 psf for panels)
  - Roof Live Load - 20 psf. (Allowable Residential Code w/o reductions)
  - The 2x4 SPF trusses spaced 24" apart were analyzed (worst case).
  - Roof Pitch 8.4/12
  - The maximum unbraced span: 7' 4" measured horizontal.
  - Analysis with the additional roof load determined that the roof trusses are 85% stressed. The trusses are in compliance with the current Residential Building Code.
  
- **Analysis of Roof Structure B:**
  - Additional dead load 15 psf (12 psf from roof + 3 psf for panels)
  - Roof Live Load - 20 psf. (Allowable Residential Code w/o reductions)
  - The 2x6 SPF trusses spaced 24" apart were analyzed (worst case).
  - Roof Pitch 15/12
  - The maximum unbraced span: 5' 10" measured horizontal.
  - Analysis with the additional roof load determined that the roof trusses are 41% stressed. The trusses are in compliance with the current Residential Building Code.
  
- **Wind Speed:** Components and cladding 118 mph wind load uplift of -40 psf.
- **Total Wind Load Uplift:** -40 psf x 432 sf = 17,280 lbs total uplift for solar array.
- **Number of Attachment Anchors:** Use a minimum of two (2) bracket per panel (one top and bottom) = 48 total attachment brackets.
- **Wind Load Uplift per Anchor:** 17,280 lbs total uplift / 48 = 360 lbs for solar array.
- **Strength of Hold-down Anchors:** The SunPower InvisiMount is reported to be used with the Pegasus Solar L-Foot. The L-Foot is attached directly into the top of the truss/truss members with a 5/16" stainless steel lag screw with at least 3" of embedment into the wood member. The load testing results determined an average pullout failure load of 556 lbs per screw, exceeding the required 360 lbs per anchor. The loading proposed creates a safety factor of 1.54 or greater for the attachment.

### Conclusions & Recommendations

Based on the information provided, it was determined that the roof truss members were adequate for the addition load of the solar panel array.

The installation of the solar panel array using Pegasus Solar L-Foot attachment bracket lagged directly into the top of the wood truss member is adequate for the loads imposed on them.

CDR & Assoc., Inc. thanks you for the opportunity to provide you with a letter for the inspection of the roof framing for the installation of solar panel system on the roof of the foresaid property hereafter referred to as "house". All references to directions or locations indicated in this report are by facing the front of the house.

**Observations and Analysis of Roof**

- **Basis of Evaluation:** The engineering analysis is based on measurements and photographs taken onsite by CDR+A technician, Brady Jarvis.
- **Roof Construction:** A layer of asphalt shingles over wood decking on roof truss members.
- **Roof Pitch:** Multiple Slopes
- **Solar Panel Array:** 24 panels.
- **Total Array Square Footage:** The panels are approximately 39.37" x 64.57" or 17.65 sf each, round up to 18 sf x 24 panels = total surface area of 432 sf.
- **Total weight of Array:** Panel weighs approximately 40 lbs. ea. X 24 = 960 lbs. for the Array.
- **Total Additional Weight on Roof:** 960 lbs / 432 sf = 2.22 psf add for rail mount system, assume 3 psf additional load on roof structure.
- **Rail Mount System:** The panels are mounted on aluminum rails at top and bottom of the panels for each row of panels.
