- DO NOT BROOM FINISH THIS AREA. PLACE AND FINISH CONCRETE AS SPECIFIED IN SECTION 3.04 "CONCRETE FINISHES AND TOLERANCES", PARAGRAPH A "GENERAL FINISHES". CURE USING 'KUREZ DR VOX' OR 'KUREZ DR 100' AT AN APPLICATION RATE OF 400 SF/GALLON
- JOINT FILLING: FILL ALL CONTROL JOINTS AS SPECIFIED IN SECTION 3.07 'INTERIOR CONCRETE JOINT FILLER", PARAGRAPH B.
- SURFACE PREPARATION: EPOXY FLOOR COATING SYSTEM IS DESIGNED FOR APPLICATION ON CONCRETE SUBSTRATES. NEWLY PLACED CONCRETE SURFACES SHOULD BE CURED FOR A MINIMUM OF 28 DAYS PRIOR TO COATING. CONCRETE SURFACES MUST BE STRUCTURALLY SOUND, FREE OF LOOSE OR DETERIORATED CONCRETE AND FREE OF DUST, DIRT, PAINT, EFFLORESCENCE, OIL AND OTHER CONTAMINANTS. MECHANICALLY ABRADE THE SURFACE TO ACHIEVE A SURFACE PROFILE EQUAL TO CSP 2-3 IN ACCORDANCE WITH ICRI GUIDELINE 310.2. PROPERLY CLEAN PROFILED AREA. THE pH OF THE SURFACE SHOULD BE CHECKED ACCORDING TO ASTM D 4262. FOLLOWING SURFACE PREPARATION. THE CLEANED SURFACE SHOULD HAVE A MINIMUM SURFACE-TENSILE STRENGTH OF 200 PSI WHEN TESTED WITH AN ELCOMETER OR SIMILAR PULL TESTER (ASTM D 4541).
- INITIAL COAT MIXING: PRE-MIX 'INCRETE HIGH PERFORMANCE EPOXY" (GRAY) PART A AND PART B, THEN COMBINE 2 PARTS BY VOLUME OF PART A WITH ONE PART BY VOLUME OF PART B, AND THEN MIX THOROUGHLY USING A LOW-SPEED DRILL MOTOR AND A 'JIFFY' TYPE MIXER. MIX ONLY THE AMOUNT OF MATERIAL THAT CAN BE APPLIED DURING THE POT LIFE. DO NOT AERATE THE MIX.
- INITIAL COAT APPLICATION: APPLY 'INCRETE HIGH PERFORMANCE EPOXY" (GRAY) AT 120 SF/GALLON. SPREAD THE MIXED EPOXY WITH A NOTCHED SQUEEGEE WHILE WEARING SPIKED SHOES. START FROM ONE END OF THE FLOOR AND WORK BACKWARDS AND SIDEWAYS TRYING TO KEEP A WET-TO-WET EDGE. THE COATING SHOULD THEN BE ROLLED IN ONE DIRECTION USING A 3/8" NAP, SHED-RESISTANT ROLLER. MAKE SURE THE MATERIAL IS APPLIED AS QUICKLY AS POSSIBLE WITHOUT LEAVING PUDDLES.
- PIGMENTED CHIP APPLICATION: BROADCAST UNTIL REFUSAL, 'INCRETE GRANITE COAT CHIPS' (MICA) IN A HIGH ARCING MOTION INTO THE WET EPOXY. ALLOW TO CURE. ONCE DRY, VACUUM/SCRAPE OFF EXCESS FLAKES. ALLOW TO DRY.
- GROUT COAT: APPLY 'INCRETE HIGH PERFORMANCE EPOXY" (CLEAR) AT 120 SF/GALLON. ALLOW TO DRY.
- WEAR COAT: APPLY A FINAL COAT OF 'INCRETE POLYSEAL POLYASPARTIC' (CLEAR) AT 120 SF/GALLON. ALLOW TO DRY.
- COVE BASE: IN ADDITION TO THE SEAMLESS INTEGRAL FLOOR, PROVIDE A 4' COVE BASE FROM THE FLOOR TO THE FRP WALL TRANSITION. COVE BASE SHALL CONSIST OF A MIXTURE OF 'INCRETE HIGH PERFORMANCE EPOXY" AND FINELY GRADED, CLEAN DRY , TROWELABLE AGGREGATES, TROWELED TO THE PREVIOUSLY INSTALLED VERTICAL CEMENT BOARD SURFACE, TO A HEIGHT OF 4 INCHES. CREATE A COVED, SEAMLESS, INTEGRAL TRANSITION AT JOINT BETWEEN WALL AND FLOOR. BROADCAST UNTIL REFUSAL, "INCRETE GRANITE COAT CHIPS' (MICA) INTO THE WET EPOXY. FINISH COVE BASE DETAIL WITH THE GROUT COAT AND WEAR COAT AS SPECIFIED HEREIN. ONCE COMPLETED, THE FLOOR AND COVE BASE SHALL BE SEAMLESS IN FUNCTION AND APPEARANCE.

a. INSTALL CEMENT WALL BOARD SO THAT THE BOTTOM EDGE IS FLUSH WITH THE FLOOR AS SPECIFIED.
b. INSTALL CEMENT WALL BOARD TAPE, SIMILAR TO GOLDBLATT PROFESSIONAL CEMENT BOARD TAPE, TO ALL JOINT OF CEMENT BOARD.
c. INSTALL FIBER REINFORCED PANELS (FRP) AS REQUIRED. DO NOT APPLY ADHESIVE TO ANY AREAS CONTACTING THE 4' COVE BASE INSTALLATION. DO NOT APPLY WATER TO ANY OF THESE SURFACES PRIOR TO INSTALLATION OF THE EPOXY FLOOR OR COVE SYSTEM.
d. INSTALL 4' COVE BASE DIRECTLY TO CEMENT BOARD. COVE BASE SHALL COME IN DIRECT CONTACT WITH THE BOTTOM EDGE OF THE FIBER REINFORCED PANELS SO THAT THE FLOOR AND COVE BASE SHALL BE SEAMLESS IN FUNCTION AND APPEARANCE.

STRUCTURAL GENERAL NOTES

DESIGN AND CODE INFORMATION

1. ALL CONSTRUCTION SHALL CONFORM TO THE NORTH CAROLINA BUILDING CODE, 2018 EDITION (BASED ON THE INTERNATIONAL BUILDING CODE, 2015 EDITION).

2. VERIFY EXISTING CONDITIONS AND ALL DIMENSIONS AND NOTIFY ARCHITECT OF ANY CONDITIONS WHICH CONFLICT WITH OTHER PLANS AND SPECIFICATIONS. STRUCTURAL DRAWINGS MUST BE COORDINATED WITH ARCHITECTURAL DRAWINGS. STRUCTURAL DRAWINGS ARE NOT INTENDED FOR BUILDING LAYOUT.

3. SHOP DRAWINGS WILL NOT BE REVIEWED BY THE DESIGNER UNTIL AFTER THE GENERAL CONTRACTOR HAS THOROUGHLY REVIEWED THE SHOP DRAWINGS, VERIFIED EXISTING CONDITIONS, AND COORDINATED THE SHOP DRAWINGS WITH OTHER AFFECTED TRADES. SUBMIT FOUR COPIES OF REVIEWED DRAWINGS FOR ENGINEER'S REVIEW. ONLY THREE SETS OF MARKED UP SHOP DRAWINGS SHALL BE RETURNED BY THE DESIGNER. REPRODUCTION OF STRUCTURAL DRAWINGS FOR SHOP DRAWINGS IS NOT PERMITTED.

4. THE STRUCTURE IS UNSTABLE UNTIL ALL LOAD BEARING WALLS ARE ERECTED AND STEEL MEMBERS ARE ERECTED, CONNECTIONS ARE COMPLETELY BOLTED AND/OR WELDED AND INSPECTED, THE STEEL DECK ATTACHED TO THE STEEL FRAMING, AND THE CONCRETE FLOORS PLACED AND ATTAINS 75% OF 28-DAY STRENGTH. UNTIL SUCH TIME, TEMPORARY BRACING IS REQUIRED. THE DESIGN ADEQUACY OF TEMPORARY BRACING AND SHORING IS THE SOLE RESPONSIBILITY OF THE CONTRACTOR.

   2. Provide non-marking tires on rubber-tired vehicles or equip rubber tires with tire boots made of nylon fabric
   3. Provide mats at all entrances to prevent mud stains

D. **Exterior Slab on Ground Concrete Curing**: All exterior slab on ground shall be cured using the specified liquid membrane-forming curing compound. Application shall be made by a trained applicator immediately following final finish. Concrete and air temperature shall be above 50ºF. Surface shall be clean and damp, but not wet and can no longer be marred by walking workmen. Apply "Super Rez Seal" or "Super Diamond Clear VOX" at an application rate of 400sf/gallon.

3.07 INTERIOR SLAB ON GROUND JOINT FILLER

A. General: Do not commence installation of semi-rigid polyurea joint filler, liquid densifier / sealer and polishing processes until the building is completely enclosed, permanent power and lighting is operating, and the building is thermostatically controlled. Installation of these materials shall commence approximately two weeks prior to "fixture date."

B. Joint Filler Installation: Comply with ACI 302 as applicable to materials, applications, and conditions.
   1. Surface cleaning of joints: Clean joints immediately before installing joint filler. Remove foreign material that could interfere with adhesion of joint filler by brushing, grinding, blast cleaning, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint filler. Remove loose particles remaining from above cleaning operations by vacuuming or blowing out joints with oil-free compressed air. Also remove all laitance and form-release agents from concrete surface. Clean nonporous surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues could interfere with adhesion of joint sealants. All surfaces to be filled shall be clean and dry.
   2. Mixing: Joint filler is a two-part product requiring machine mixing and placing. Premix Part "B" separately before using. Follow pump manufacturer's equipment instructions.
   3. Placement: For proper load transfer, joints must be filled full depth, but in no case should the joint filler be any less than 1" deep in the joint. No backer rod is allowed. Joints should be overfilled and shaved level with the surface, giving the floor joints a flat, smooth appearance.
   4. Joint filler separation: The trained joint filling applicator shall include in their bid a cost per linear foot to make one return trip to refill joints if joint filler sidewall separation or splitting exceeds 1/16", or if surface profile is concave, chattered or if voids occur. This shall take place one week prior to grand opening, or at Owner's request.

C. Initial cleaning for liquid densifier and sealer application: thoroughly clean the interior slab on ground prior to the initial application of liquid densifier/sealer and polishing process. Completely remove the remnants of the specified dissipating or removable curing compound from the floor surface. The following floor stripper or removal solution shall be applied to the floor at the proper rate to thoroughly strip, clean and remove all curing compound residue:
   a. "Euco Clean & Strip" by Euclid chemical

D. Polishing process and application of liquid densifier / sealer: prior to application, inspect interior slab on ground to ensure that slab is clean and free of dust, grease, oils, or other contaminants that might prohibit the proper application and penetration of the liquid densifier and sealer.
   1. The following process is provided as a guide. Many factors, including, but not limited to interior slab on ground finish, hardness and flatness will determine the initial diamond tooling, including additional grinding and/or polishing operations required to meet the specifications specified herein. The trained applicator shall provide a test polish, including application of liquid densifier/sealer to a designated area of the interior slab on ground, using the same equipment, tools and methods as will be used to polish the interior slab on ground. Floor polishing and application of liquid densifier/sealer shall not commence until general contractor has accepted the polished interior slab on ground test slab.
   2. Step one: using equipment with sufficient head pressure (≥ 150 psi), thoroughly clean, and then grind concrete floor with a combo set of 60 grit resin bond diamonds and 100 grit resin bond diamonds (not pads). Each pass must overlap 50% of the previous pass. Grind the concrete floor to allow for an even scratch pattern. Clean floor thoroughly after this pass.
   3. Step two: apply Euclid diamond hard liquid densifier/sealer at 225 square feet per gallon.
   4. Step three: using equipment with sufficient head pressure (≥ 150 psi) polish concrete floor with a combo set of 100 grit resin bond diamonds and 200 grit resin bond diamonds (not pads). Each pass must overlap 50% of the previous pass. Polish the concrete floor to allow for an even scratch pattern. Clean floor thoroughly after this pass.
   5. Step four: using equipment with sufficient head pressure (≥ 150 psi) polish concrete floor with 400 grit resin bond diamonds (not pads). Each pass must overlap 50% of the previous pass. Polish the concrete floor to allow for an even scratch pattern. Clean floor thoroughly after this pass.
   6. Step five: apply Euclid diamond hard liquid densifier/sealer at 700 square feet per gallon.
   7. Step six: burnish/polish concrete floor with 800 grit diamond impregnated pads
   8. Step seven: burnish/polish concrete floor with 1500 grit diamond impregnated pads
   9. Polish results: perform polishing process to reach a specified overall gloss value (SOGV) of ≥35 as measured with a HORIBA ig-320, and a specified minimum gloss reading (SMGV) of ≥30. The trained applicator shall take four gloss measurement readings at 90º from each other, and then averaged for one reading at each location. A minimum of 25 readings shall be taken throughout the interior slab on ground. The overall measurement shall be reported to general contractor within 24 hours of the polishing process. Gloss shall be considered a quantitative value that expresses the degree of reflection when light hits the concrete floor surface. Gloss measurements will be taken independent of ambient lighting and will be taken within a sealed measurement window located beneath the test unit.

3.08 URETHANE EXPANSION JOINT SEALANT APPLICATION

A. Urethane Joint Sealant Application:
   1. Apply joint sealants in accordance with manufacturer's written instructions.
   2. Back-up material:
      a. Install appropriate size backer rod, larger than the joint where necessary per manufacturer's recommendations and in a manner to provide concave sealant profile.
      b. Where joint depth does not permit installation of backer rod, install adhesive-backed polyethylene bond-breaker tape along the entire back of joint to prevent 3-sided adhesion of joint sealant.
   3. Sealant: Verify that the temperature and moisture conditions are within manufacturer's acceptable limits. Using fresh sealant and equipment that is in proper working order, completely fill joint with sealant, filling from bottom up to avoid entrapping air.
   4. Using clean, dry tool with rounded edge and of appropriate width for each joint, tool freshly installed sealant to provide preferred concave profile, to ensure intimate contact between sealant and substrate and to provide neat appearance. Where surface aggregate does not permit proper tooling, install sealant and backer rod so that face of joint is recessed behind exposed aggregate and sealant is bonded to firm, even surface. Use dry tooling method. Do not use tooling agents such as soapy water or tooling agents that have not been approved by sealant manufacturer.

UNLESS OTHERWISE NOTED BY TSC, CONCRETE FLOOR SLAB SHALL BE CAST AS ONE CONTINUOUS POUR. CONTRACTOR SHALL PROVIDE TERMITE PROTECTION. APPLY TERMITICIDE TO SUB-BASE BEFORE CONCRETE IS POURED. PROVIDE ONE GALLON OF DILUTED TERMITICIDE PER 10 SQUARE FEET OF SLAB AREA. APPLY AN ADDITIONAL 2-4 GALLONS PER 10 LINEAR FEET AT THE FOUNDATION PERIMETER.

NOTE: THIS SPEC IS WRITTEN AROUND ASTM STANDARDS. GENERAL CONTRACTOR AND DEVELOPER SHALL BE RESPONSIBLE FOR OVERALL QUALITY OF PRODUCTS SELECTED AND WORKMANSHIP OF SLAB.

ARCHITECT AND CONTRACTOR TO PAY SPECIAL ATTENTION TO ACHIEVE DESIGN THAT PREVENTS THE CONCRETE FROM HEAVING AT ALL DOORWAYS ESPECIALLY IN COLD WEATHER LOCATIONS.

TSC LVW CONTROL WIRING AND EMS PREWIRE:

ALL LOW VOLTAGE WIRING (LVW) (EXCEPT FOR TEMPORARY AND PERMANENT THERMOSTATS FOR HVAC) TO BE INSTALLED BY THE LVW VENDOR. THIS INCLUDES THE DOOR BELLS. GC'S ARE RESPONSIBLE TO COMMUNICATE, TO MANAGE, AND TO INCLUDE THIS IN THEIR COSTS.

Cable Specifications:

ALL cable must be jacketed in a fire-retardant material, shielded (unless otherwise noted) and WHITE in color. In the event that a specific cable is not available, Contractor may substitute for a cable with more conductors (i.e. 2 conductor can be substituted with 3 conductor of the same ratings).

Maximum cable length shall not exceed 330 feet.

Do not route cables over or touching a fluorescent light. Cross over fluorescent lights perpendicular to the length of the fixture.

All cables shall be supported from the ceiling joist above. Do not lay cables on the grid of a drop ceiling.

Type
one twisted pair – 18ga – shielded – plenum rated – white jacket
one CAT5 Cable

Preface: This store will be wired for a future EMS system This contractor shall price in the base bid wiring.

LV1 G.C. shall install a 2" EMT conduit into the top of the future EMS section of the unitized switchboard (hereafter referred to as the EMS cabinet) so as to provide EMS cable access to the panel without having to route the cables past substantial line voltage wire.

LV2 G.C. shall provide a 3/4" (inch) trade size rigid conduit or seal tight from the RTU control panel stubbed into the TSC space for low voltage wiring access.

LV3 Tractor Supply shall provide EMS jack in one of 6– up boxes in the IT CLOSET and an orange patch, with white boot, cable connected to port 23 on the 2960 switch and run to port #46 on the patch panel.

LV4 G.C. shall install a recessed single gang switch box in corridor next to manager's office – see mechanical drawings for exact placement. This box should be mounted 60" AFF. This box is for installation of the RTUS thermostat / future EMS control thermostat.

LV5 G.C. shall install a double gang switch box (4 11/16" with the appropriate adapter plates) on the column closest to each sales floor RTU 1 and 2 for the purpose of installing the Thermostat /future EMS thermostat (see LV6 for specifics about RTU 3 and 4). If HVAC is needed to condition the building prior to the installation of the LVW by the TSC LVW vendor, the G.C. is to make HVAC units operable using temporary bi–metal thermostats to be hung in return air duct. This allows for conditioning of the building temporarily until the TSC LVW vendor installs permanent LVW per the timing and action calendar contained within the set of plans. Once the LVW vendor installs the LVW, the G.C. is responsible to remove the temporary bi–metal thermostats and make final connections of the thermostats to the newly installed LVW as mentioned above.

LV6 G.C. shall install 3 double gang switch boxes (4 11/16" with the appropriate adapter plates) on the column closest to RTU 3 and 4. These 3 boxes shall be mounted vertically; one above the other, separated by no less than 6" with the bottom box mounted at a height of approximately 7' 6" AFF and MUST be mounted to the surface of the column that faces the center of the building so as to shield the sensor from direct supply air. A quantity of (2) 1" (inch) conduits shall be installed above & between the boxes so as to provide a path for continuous wire pull from the overhead into the bottom most box. These boxes are for (from top to bottom) the installation of the CO2 sensor, the humidity sensor, and the RTU thermostat / future EMS thermostat in the bottom box each of which requires a dedicated double gang box. "Doubling up" the sensors in a 2 gang box is not acceptable.

LV7 G.C. shall install a single gang box and a 3/4" EMT conduit for the vestibule Unit Heater and the greenhouse's Unit Heater. The conduits shall be installed from the ceiling deck to each unit heater's thermostat designated mounting location in the vestibule and stockroom. G.C. is to make each unit heater operate using the thermostats provided with the unit heaters and installed wiring.

LV8 G.C. shall install a 3/4" EMT conduit from the ceiling deck to 12" (inches) AFF so as to provide future EMS cable access for routing the LV cable from above the dock door to the finished floor. The conduit is to be installed directly adjacent to the dock door, within 2" (inches) of the rollup door track.

LV9 J–box for power to the series 800 power supply mounted above the ceiling in line with the hinge side of the door. Provide a 1/2" conduit from the power supply to the electric power transfer device (PT–5) of the door frame, concealed mortise mount. Provide and pull two #18 AWG wire from the power supply to the power transfer device and into the door. Contractor to complete wiring and connection of the delayed rim exit device after new door and rim exit hardware is installed. Coordinate all requirements with supplier/installer. See detail 12/E3.2.

LV10 LVW vendor shall install a total of (1) 18/2 SHIELDED plenum cable. The cable shall be pulled continuous from the future "EMS Cabinet" in the electrical switchgear to each Unit Heater's & RTU's thermostat gang boxes location (see LV5 and LV6 for specifics) in turn (Daisy Chain) starting with the Unit Heater / RTU thermostat mounting location closest to the electrical room. The wire shall be pulled into the RTU's designated gang box, leaving a 5' coil. Label both un–spliced ends of this cable pull as "TStat COMM".

LV11 LVW vendor shall install a total of (1) 18/10 NON–SHIELDED plenum cable. The cable shall be pulled from each RTU's control cabinet to the RTU specific thermostat gang box, leaving a 5' coil at both ends. Label both ends of this cable "RTUx CONTROL", where x is the RTU #.

LV12 LVW vendor shall install a total of (1) 18/10 NON–SHIELDED plenum cable. The cable shall be pulled from each RTU's supply hard air duct, just below ceiling, to the corresponding RTUs thermostat gang box, leaving a 10' coil at both ends. Label both ends of this cable "RTUx SUPPLY", where x is the RTU #.

LV13 LVW vendor shall install a total of (1) 18/10 NON–SHIELDED plenum cable. The cable shall be pulled from the EMS cabinet to the future "WeatherStation", leaving a 5' coil at both ends. Label both ends of this cable "OA TEMP".

LV14 LVW vendor shall install a total of (1) 18/10 NON–SHIELDED plenum cable. The cable shall be pulled from the EMS cabinet to the future "WeatherStation", leaving a 5' coil at both ends. Label both ends of this cable "OA HUMID".

LV15 LVW vendor shall install a total of (1) 18/10 NON–SHIELDED plenum cable. The cable shall be pulled from the EMS cabinet to the future "WeatherStation", leaving a 5' coil at both ends. Label both ends of this cable "OUTDOOR LIGHT LEVEL".

LV16 For each indoor humidity sensor specified, the LVW vendor shall install a total of (1) 18/4 NON–SHIELDED plenum cables. The cables shall be pulled from the EMS cabinet to the top single gang box installed as per note LV6, leaving a 5' coil at both ends. Label both ends of this cable "INSIDE HUMID #1" and, if installed, "INSIDE HUMID #2".

LV17 LVW vendor shall install a total of (1) 18/2 NON–SHIELDED plenum cable. The cables shall be pulled from the EMS cabinet to the next to the top single gang box installed as per note LV6, leaving a 5' coil at both ends. Label both ends of this cable "CO2".

LV18 LVW vendor shall install a total of (1) 18/2 NON–SHIELDED plenum cable in 1/2" conduit. The cable shall be pulled from the EMS cabinet to the vaccine case, leaving a 5' coil at both ends. Label both ends of this cable "VACCINE TEMP". Coordinate with the GC to determine the exact location. NOTE: IN THE EVENT THAT THE FINAL LOCATION OF THE ANIMAL HEALTH CASE IS UNKNOWN, LEAVE A 50' COIL OF CABLE IN THE APPROXIMATE LOCATION.

LV19 LVW vendor shall install a total of (1) 18/4 NON–SHIELDED plenum cable. The cables shall be pulled from the EMS cabinet to the alarm installer's junction box labeled "EMS/SI ALARM INTERFACE" (located on the telephone board, beside the security alarm panel), leaving a 5' coil of each at both ends. Label both ends of each these cables "OCCUPANCY" and "ALL LIGHTS ON" respectively. If the security system installer has not installed this junction box, install and label these cables leaving a 15' loop of each at the ceiling joist on the vicinity of the building security system equipment.

LV20 ALARM VENDOR shall install a total of two twisted pair, 18ga plenum cables (Windy City # 002320–S or equivalent). The cables shall be pulled from the Security Panel to the junction box labeled "EMS/SI ALARM INTERFACE" (located on the telephone board, at the designated location beside the security alarm panel). ALARM VENDOR to terminate this wiring to the appropriate security system "ARM/DISARM" and "ALARM" outputs to the corresponding terminals within the "EMS/SI Alarm interface" junction box (installed by the LVW vendor). If the LVW Vendor has not installed this junction box, ALARM VENDOR to install and label their cables leaving a 5' loop at the designated location of the EMS/SI ALARM interface" on the telephone backboard.

LV21 LVW vendor shall install a total of (1) 18/2 NON–SHIELDED plenum cable. The cable shall be pulled from the EMS cabinet through the EMT conduit installed for dock door monitoring, leaving a 5' coil at both ends. Label both ends of this cable "DOCK DOOR". This is used for future EMS monitoring and is in addition to the cabling required for the security system door monitoring. This EMS cable should be pulled down through the conduit that is installed to monitor the dock door via the EMS (see LV8). Coordinate with the GC to determine the exact location. NOTE: IN THE EVENT THAT THE FINAL LOCATION OF THE DOCK DOOR EMS CONDUIT IS UNKNOWN, LEAVE A 50' COIL OF CABLE ABOVE THE DOCK DOOR.

LV22 LVW Vendor to install a total of (1) 18/4 NON–SHIELDED plenum cable for each unit heater. The cable shall be pulled from each Unit Heater's control cabinet to the Unit Heater's specific thermostat gang box, leaving a 5' coil at both ends. Label both ends of this cable "UH Control". Note: In the event that the location of the unit heater is unknown, leave a 50' coil of cable at this location.
