Summary of Services Performed (field test data, locations, elevations & depths are estimates) & Individuals Contacted.

The undersigned arrived on site, as requested, to check the bearing capacity of soil via hand auger/DCP method for porch backfill. Please see the attached sketch and data sheet for details.

A hand auger was used to advance the boreholes to different depths noted on the boring logs. Dynamic cone penetrometer DCP test were into the soil by a 15 pound ring weight with a free fall of 20 inches. The number of blows required to drive the cone into the soil a distance of 1.75 inches is termed the DCP value is indicated for each test on hand auger.

A total of 1 hand auger/DCP evaluation was performed to depth of approximately 3 feet below the current sub grade elevation. Test results indicated that the materials in place at the locations and elevations tested did appear to be suitable to support a design bearing capacity of 2000 psf.
